

Day 1 Hardware Introduction

1. Draw a labeled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage components.

2. Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use cases

Feature	HDD	SSD
Speed	between 80 MB/s and 160 MB/s	500–550 MB/s
Durability	Less Durable	More Durable
use cases	Showing Movie , Photos, Backups , Zips	Operating system , software , Gaming , video editing , fast file access
Price	Cheaper	Costly
Capacity	500 GB – 24 TB+	256 GB – 8 TB+

3. Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC.

CPU (Control Processing Unit) – Overall instructions manage to operate a Game. Game Calculations , Physics , Multiplayer Processing , Fps Processing

Ram – In Games like Pubg or Free fire in that Ram is for store Running resources / Temp resources in Ram for Access current asset. Ram is get only current part of game like if game is 10GB and you play 1 Gb map so only 1 gb is load in Ram.

GPU – Mainly use for Rendering graphics for the game , As per Your Graphics Card you can choose A game settings for smooth run , Render Shadows , manage fps , Resolution Lighting , Textures , Reflections .

You can get more fps if you set graphics low.

4. Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each.

We Gonna Upgrade few Components Of PC:

CPU - We need AMD Ryzen 7 2700X or Intel Core i7 6700 For A better Smooth Play , Processing

MEMORY: We need to require 12 GB Ram for smooth loading of game , store a playable part of game , render more chunks.

GRAPHICS: We need to require AMD RX 5600 XT or Nvidia GTX 166- Graphics Card for playing a game with good Graphics , Render Shadow , **Ray tracing**

Storage: We need to require 100 gb free spaces for a store game , And recommended to Add Sdd.
