

Day 3 – Hardware Assignment

1. Create a comparison table listing the main differences between DDR3, DDR4, and DDR5 RAM, including speed, voltage, and typical use cases.

Feature	DDR3	DDR4	DDR5
speed	800–2133 MT/s	1600–3200 MT/s	4800–6400+ MT/s
voltage	1.5 V	1.2 V	1.1 V
use cases	Older PCs and laptops	PCs from around 2014–2021	Modern PCs and laptops
Efficiency	Lower	Better	Best
Current Status	Outdated	Older but still usable	Current standard

2. Open your laptop or desktop (with power disconnected), locate the RAM slots, and take a clear photo of the installed RAM module. Reinstall the RAM module and verify that your system boots up successfully .

Steps to Remove and Reinstall RAM

- 1 Power Off Computer and disconnect the power cable.
- 2 Locate the ram slot In the Cabbinet
- 3 Remove Ram by a opening both clips at the end of Ram.
- 4 Hold Ram and pull of.
- 5 Check Ram and see small notch on the bottom of ram and that's check the ram is correctly fit or not.
- 6 Reinstall Ram Align the notch with slot and when you press automatically the locking clips lock.
- 7 Close pc case , reconnect power cable.
- 8 Trun On Computer and Start normally bios will detect the ram

3. List three key differences between HDD, SSD, and NVMe storage types, and for each, name one app or use case (from apps you use daily) that would benefit most from that storage type.

Feature	HDD	SSD	NVMe SSD
Technology	Magnetic spinning disks	Flash memory	Flash memory using PCIe
Speed	Slowest, ~80–200 MB/s	~500–550 MB/s	~2,000–7,500+ MB/s
Connection	SATA	SATA	PCIe / M.2
Best Daily Use / App	File backup & movie storage	Spotify – faster app loading and caching	Gaming (RDR2/GTA 5) – faster game loading
Cost	Cheapest per GB	Moderate	Higher
Moving Parts	Yes	No	No

- 4 Remove the storage drive (HDD or SSD) from your system, take a photo of the connector type (SATA, M.2, or NVMe), and reinstall the drive. Confirm that your device recognizes the storage after reassembly.
