

operating system information , windows, Linux , macos Installation and adjust OS settings

1. On your Windows laptop or PC, open 'System Information' and take a screenshot showing your OS version, processor, and RAM details

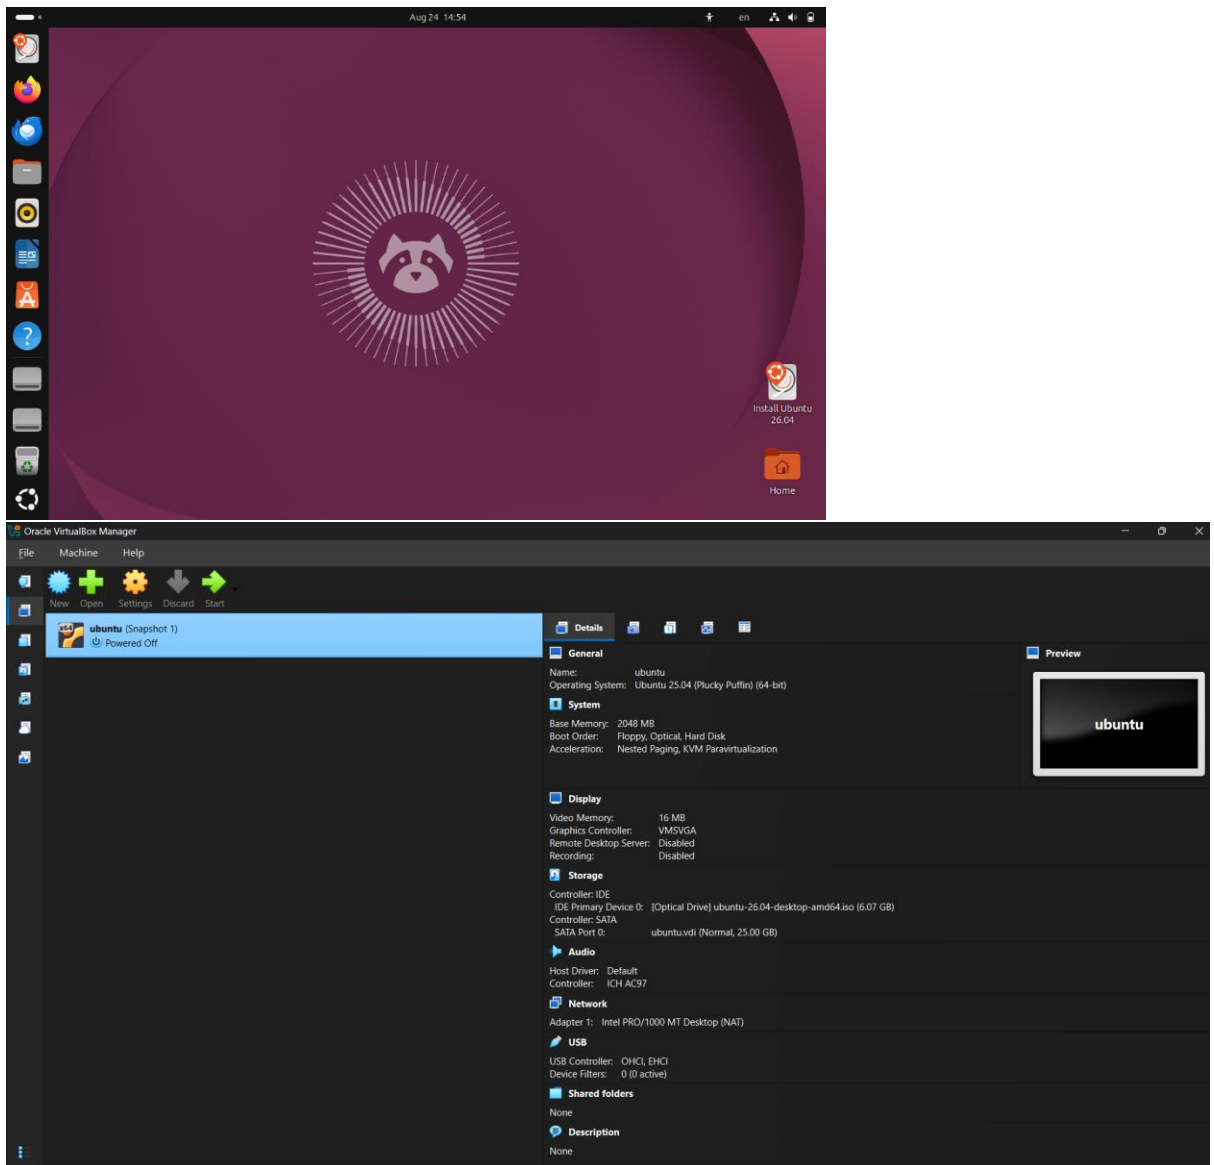

The screenshot shows the Windows System Information window. The left sidebar has a tree view with 'System Summary' selected. The main area displays a table of system information.

Item	Value
OS Name	Microsoft Windows 11 Home Single Language
Version	10.0.26200 Build 26200
Other OS Description	Not Available
OS Manufacturer	Microsoft Corporation
System Name	HARSH
System Manufacturer	ASUSTeK COMPUTER INC.
System Model	ASUS TUF Gaming A15 FA507RE_FA577RE
System Type	x64-based PC
System SKU	
Processor	AMD Ryzen 7 6800H with Radeon Graphics, 3201 Mhz, 8 Core(s), 16 Logical...
BIOS Version/Date	American Megatrends International, LLC. FA507RE.315, 11/30/2022
SMBIOS Version	3.4
Embedded Controller Version	3.07
BIOS Mode	UEFI
BaseBoard Manufacturer	ASUSTeK COMPUTER INC.
BaseBoard Product	FA507RE
BaseBoard Version	1.0
Platform Role	Mobile
Secure Boot State	On
PCR7 Configuration	Elevation Required to View
Windows Directory	C:\WINDOWS
System Directory	C:\WINDOWS\system32
Boot Device	\Device\HarddiskVolume1
Locale	United States
Hardware Abstraction Layer	Version = "10.0.26100.1"
User Name	HARSH\Harsh
Time Zone	India Standard Time
Installed Physical Memory (RAM)	16.0 GB
Total Physical Memory	15.2 GB
Available Physical Memory	5.40 GB
Total Virtual Memory	31.2 GB
Available Virtual Memory	15.2 GB
Page File Space	16.0 GB
Page File	C:\pagefile.sys

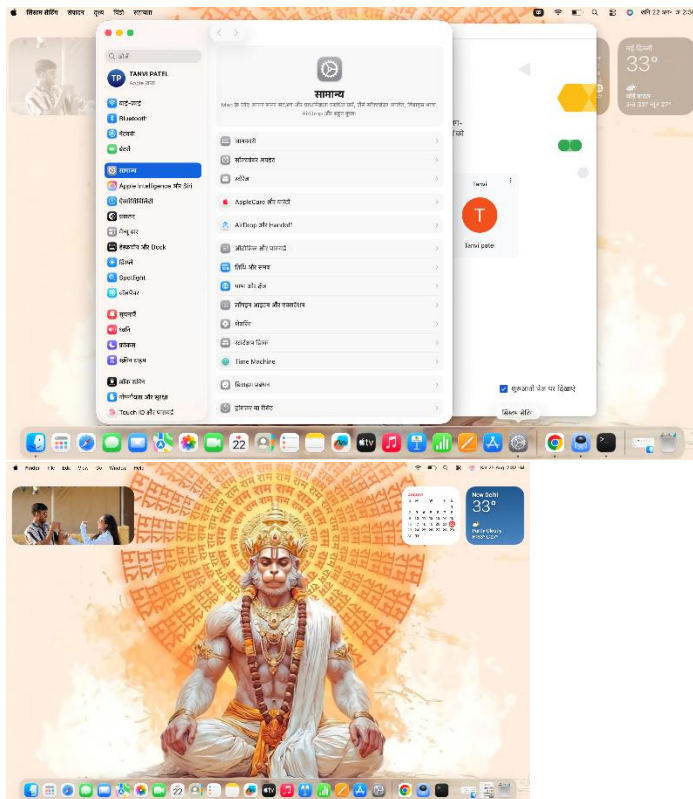

- 2 Download any official Linux distribution ISO (like Ubuntu or Fedora), and use Rufus or BalenaEtcher to create a bootable USB drive for installation.

I downloaded the official Ubuntu Linux ISO and installed VirtualBox to create a virtual machine. Instead of using Rufus or BalenaEtcher with a physical USB drive, I mounted the Ubuntu ISO file directly in the VirtualBox virtual machine. I then started the VM and followed the Ubuntu installation process, including selecting the language, creating a user account, and setting up the virtual disk. Ubuntu was successfully installed and started inside the virtual machine, demonstrating how a Linux distribution can be installed without using a physical bootable USB drive.

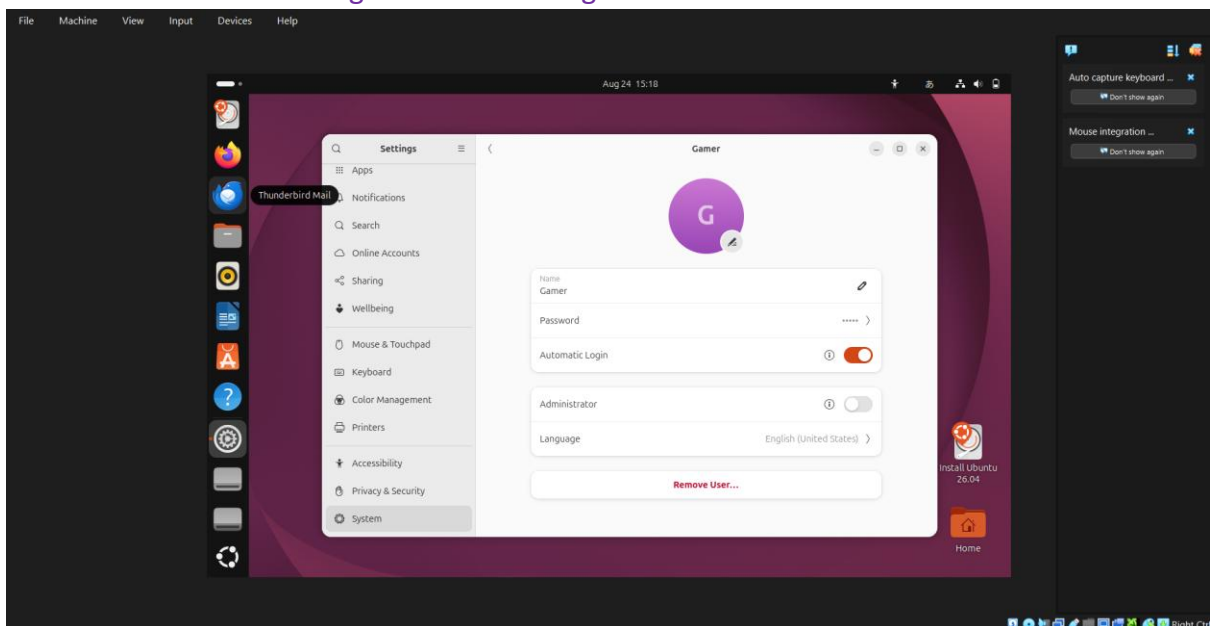

3 On a macOS device (or using a macOS virtual machine), open 'System Preferences' and change the desktop wallpaper, then adjust the system language to Hindi or Gujarati.

4 Install a fresh copy of Ubuntu Linux (real or virtual machine) and create a new user account named 'gamer'. After installation, enable automatic login for this user and take a screenshot of the login screen showing the username.

So in this we go setting and go to system and add the user in ubuntu vm machine. And set a password.

5 Use ChatGPT to generate a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates. Follow the guide and note any steps that were unclear or missing.

Installing Windows 10 on a Laptop

Step 1: Prepare the Laptop

1. Back up all important files because installation may erase existing data.
2. Connect the laptop to a power source.
3. Prepare a bootable Windows 10 USB drive with at least 8 GB of storage.
4. Keep the Windows product key available if required.

Step 2: Boot from the USB

1. Insert the Windows 10 USB drive.
2. Restart the laptop and open the Boot Menu using a key such as F12, F9, Esc, or F2, depending on the laptop.
3. Select the USB drive as the boot device.
4. Press a key when prompted to start the installation.

Step 3: Start Windows Installation

1. Select the language, time and currency format, and keyboard layout.
2. Click **Install Now**.
3. Enter the product key or select **I don't have a product key** to activate Windows later.
4. Select the required Windows 10 edition.
5. Accept the license terms.
6. Select **Custom: Install Windows only (advanced)** for a clean installation.

Step 4: Partition the Drive

1. Review the available partitions carefully.
2. Delete or format old Windows partitions only after confirming that important data has been backed up.
3. Select the unallocated space and click **New** to create a partition.
4. A practical setup is to keep around **100–150 GB** for the C: drive for Windows and applications, with the remaining space used for personal files.
5. Windows will automatically create some required system partitions.
6. Select the intended Windows partition and click **Next**.

Partitioning tip: Never delete or format a partition unless you are sure what it contains. Important personal files or recovery partitions could be lost.

Step 5: Complete the Installation

1. Windows will copy the required files and restart the laptop several times.
2. Remove the USB drive if the laptop starts the installation again after restarting.
3. Follow the on-screen setup instructions.
4. Create or sign in to a user account.
5. Connect the laptop to Wi-Fi or Ethernet.

Step 6: Install Drivers

1. Open **Settings → Update & Security → Windows Update**.
2. Check for available updates and drivers.
3. If any drivers are missing, download them from the laptop manufacturer's official website.
4. Restart the laptop after installing important drivers.

Step 7: Configure Windows Updates

1. Open **Settings → Update & Security → Windows Update**.
2. Click **Check for updates**.
3. Install available security and system updates.
4. Restart the laptop when required.
5. Check for updates again until there are no important updates remaining.

Step 8: Configure Privacy Settings

1. Open **Settings → Privacy**.
2. Review permissions for location, camera, microphone, contacts, and other personal information.
3. Disable permissions that are not required by your applications.
4. Review **Diagnostics & feedback** and choose the minimum available diagnostic data.
5. Review app permissions and background activity.
6. Turn off personalized advertising if you do not want Windows to use your advertising ID.

Step 9: Final Setup

1. Activate Windows through **Settings → Update & Security → Activation**.
2. Install the applications you need.
3. Make sure Windows Security/Defender is enabled.
4. Restore your backed-up personal files.
5. Create a recovery backup or restore point.
6. Restart the laptop and check that Wi-Fi, sound, display, keyboard, touchpad, and other hardware are working properly.

Steps That Were Unclear or Missing

While following the guide, some details may vary depending on the laptop model.

The exact **Boot Menu key** is different for different laptops, so the manufacturer's instructions may be needed. The recommended **partition size** can also vary depending on the available storage and how the laptop will be used.

One important point is that **Windows 10 support ended on October 14, 2025**.

Therefore, in 2026, Windows 11 or another currently supported operating system would generally be a safer choice unless Windows 10 is required for compatibility.
